

Tomographic cross-correlation of the CMB lensing and galaxy clustering – systematic errors from cross-talk between redshift bins of galaxies

Paweł Bielewicz

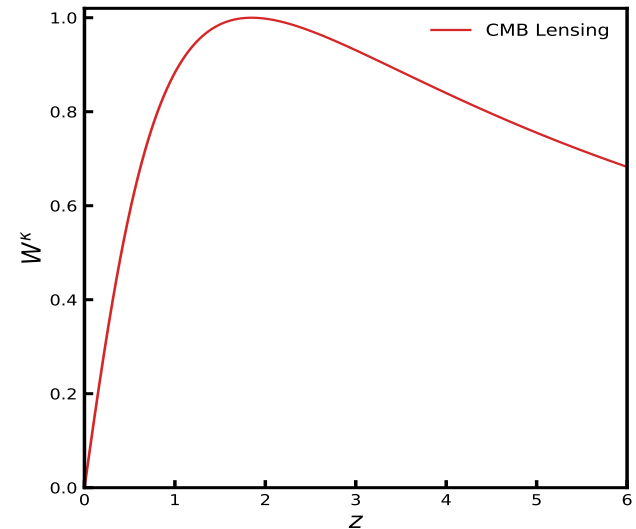

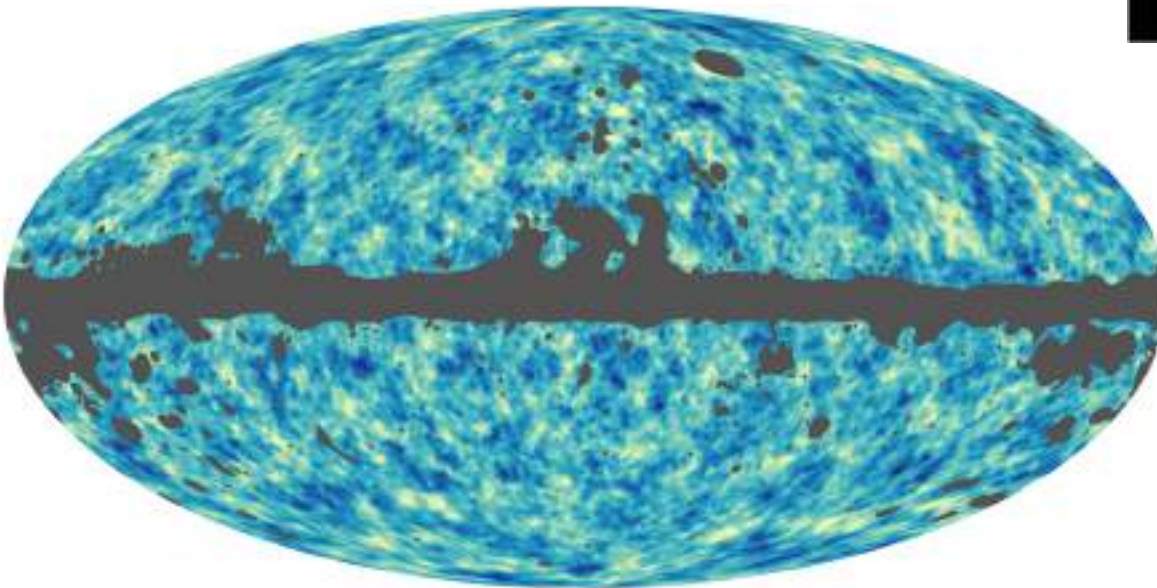

Chandra Shekhar Saraf

CMB lensing

- Deflection of the CMB photon paths by the large scale structure of the Universe ($\sim 3'$)
- Correlation of deflection angles over the sky
- Reconstruction of lensing potential from perturbations of statistical properties of CMB anisotropy
- Tracer of dark matter distribution in broad redshift range

$$\phi(\hat{n}) = -\frac{2}{c^2} \int_0^{\chi_{\text{rec}}} d\chi \frac{D_{ls}}{D_l D_s} \Psi(\chi_0 - \chi, \chi \hat{n})$$

Planck collaboration et al. (2020)

Cross-correlation between CMB lensing and galaxy surveys

- Broad CMB lensing kernel does not allow tracing time evolution of dark matter
- Needed cross-correlation of CMB lensing map with objects with known redshift (galaxies, quasars, radio sources, etc.)
- Splitting redshift distribution on redshift bins (cosmic tomography: White et al. 2022; Pandey et al. 2022; Chang et al. 2022; Sun et al. 2022; Krolewski et al. 2021; Hang et al. 2021; Peacock & Bilicki 2018)

$$\phi(\hat{n}) = -\frac{2}{c^2} \int_0^{\chi_{rec}} d\chi \frac{D_{ls}}{D_l D_s} \Psi(\chi_0 - \chi, \chi \hat{n})$$

Saraf, PB in preparation

Cross-correlation power spectrum

- Power spectrum of cross-correlation between CMB lensing and galaxy density contrast

$$C_{\ell}^{\kappa g} = \int_0^{\chi_*} d\chi \frac{W^{\kappa}(\chi) W^g(\chi)}{\chi^2} P_m \left(k = \frac{\ell + 1/2}{\chi}, z(\chi) \right) \quad \theta \sim \frac{\pi}{\ell}$$

$$\kappa(\hat{\mathbf{n}}) = -\frac{1}{2} \nabla^2 \phi(\hat{\mathbf{n}})$$

$$g = \frac{n - \bar{n}}{\bar{n}}$$

$$W^{\kappa}(\chi) = \frac{3\Omega_m}{2c^2} H_0^2 (1+z) \chi \frac{\chi_* - \chi}{\chi_*}$$

$$W^g(\chi) = b(z(\chi)) \frac{H(\chi)}{c} \frac{dN}{dz(\chi)}$$

Testing tomographic cross-correlation

- How well can we measure cross-correlations in different redshift bins given photometric redshift errors?
- Test using simulations of forthcoming galaxy photometric surveys (LSST)
- 300 simulations of correlated log-normal galaxy over-density (with LSST Science Book redshift distribution) and CMB lensing convergence fields (consistent with Planck CMB lensing map) using Full-sky Lognormal Astro-fields Simulation Kit (FLASK) code (Xavier et al. 2016)

Tomographic binning of redshift distribution

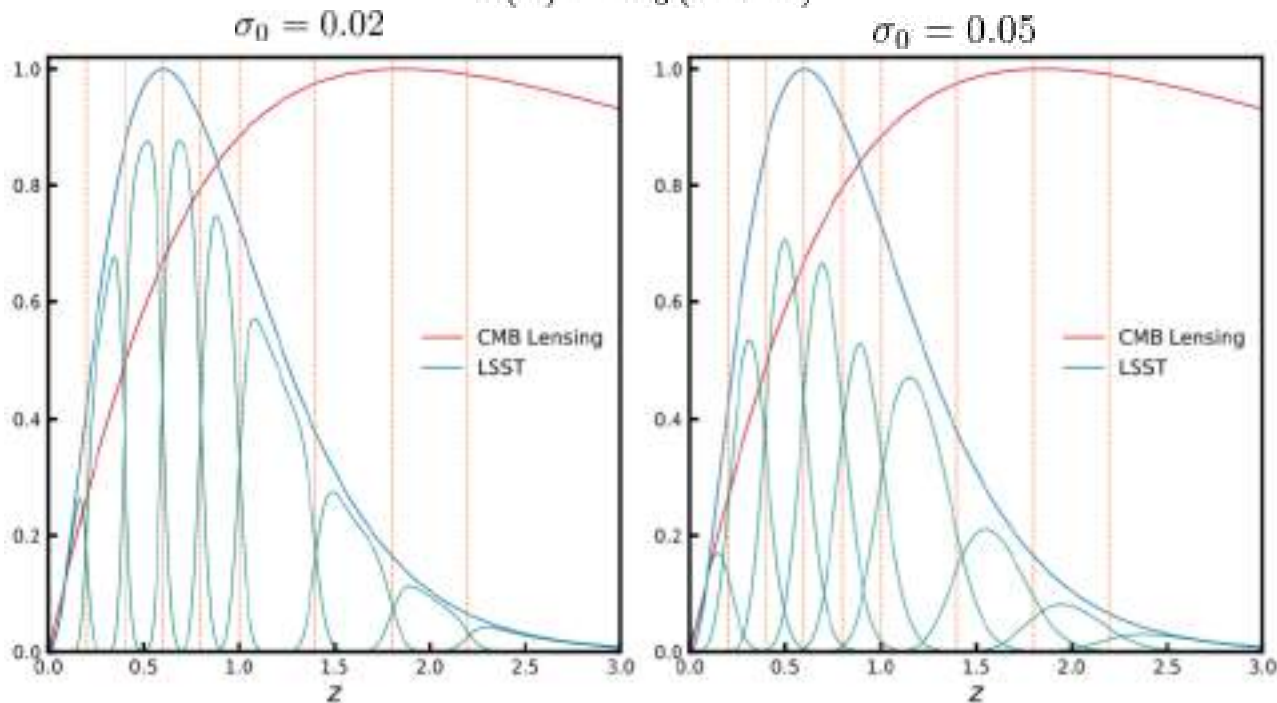

- Photometric redshifts z_p obtained by adding Gaussian photo- z errors to true redshifts z_t

$$\frac{dN(z_p)}{dz_p} = \int dz_t \frac{dN(z_t)}{dz_t} p(z_p - z_t | z_t) \quad p(z_p - z_t | z_t) = G(z_t, \sigma(z_t)) \quad \sigma(z) = \sigma_0(1 + z)$$

- Tomographic binning of the true redshift distribution

$$\frac{dN^i(z_p)}{dz_p} = \int dz_t \frac{dN(z_t)}{dz_t} W^i(z_t) p^i(z_p - z_t | z_t) \quad W^i(z_t) = \begin{cases} 1, & \text{if } z_{\min}^i \leq z_t < z_{\min}^{i+1} \\ 0, & \text{otherwise} \end{cases}$$

$$\sigma(z) = \sigma_0(1 + z)$$

Power spectra for tomographic analysis

- Power spectra for galaxies with photometric redshifts are related to power spectra for galaxies with true redshifts by (Zhang et al. 2010):

$$C_{ij}^{gg,Ph}(\ell) = \sum_k P_{ki} P_{kj} C_{kk}^{gg,Tr}(\ell)$$

$$C_i^{\kappa g,Ph}(\ell) = \sum_k P_{ki} C_{kk}^{\kappa g,Tr}(\ell)$$

where $P_{ij} \equiv \frac{N_{i \rightarrow j}}{N_j^{Ph}}$ is so called scattering matrix

- Zhang et al. (2017) proposed algorithm, Non-negative Matrix Factorization, to solve

for P_{ij} and $C_{kk}^{Tr}(\ell)$ having $C_{ij}^{Ph}(\ell)$

- With estimation of the true redshift distribution it is possible fast method of computation of the scattering matrix

(a) $\langle P \rangle$

(b) $\langle P \rangle$

$$|\langle P - P^{True} \rangle| < 0.006$$

Saraf, PB in preparation

- Naive approach to model power spectra for galaxies with photo-z

$$C_i^{gg,Ph}(\ell) = \int_0^{\chi_*} \frac{d\chi}{\chi^2} \left(b(z_p) \frac{dN^i(z_p)}{dz_p} \right)^2 P_m \left(k = \frac{\ell + 1/2}{\chi}, z_p(\chi) \right)$$

$$C_i^{\kappa g,Ph}(\ell) = \int_0^{\chi_*} \frac{d\chi}{\chi^2} W^\kappa(\chi) b(z_p) \frac{dN^i(z_p)}{dz_p} P_m \left(k = \frac{\ell + 1/2}{\chi}, z_p(\chi) \right)$$

- Estimation of the angular power spectra

$$\hat{C}_L^{xy} = \sum_{L'} K_{LL'}^{-1} \left(\tilde{C}_{L'}^{xy} - \langle \tilde{N}_{L'}^{xy} \rangle_{MC} \right) \quad \tilde{C}_\ell^{xy} = \frac{\sum_m \tilde{a}_{\ell m}^x \tilde{a}_{\ell m}^{y*}}{2\ell + 1}$$

Saraf, PB in preparation

Tests for simulations without photo-z errors

- Estimation of the angular power spectra

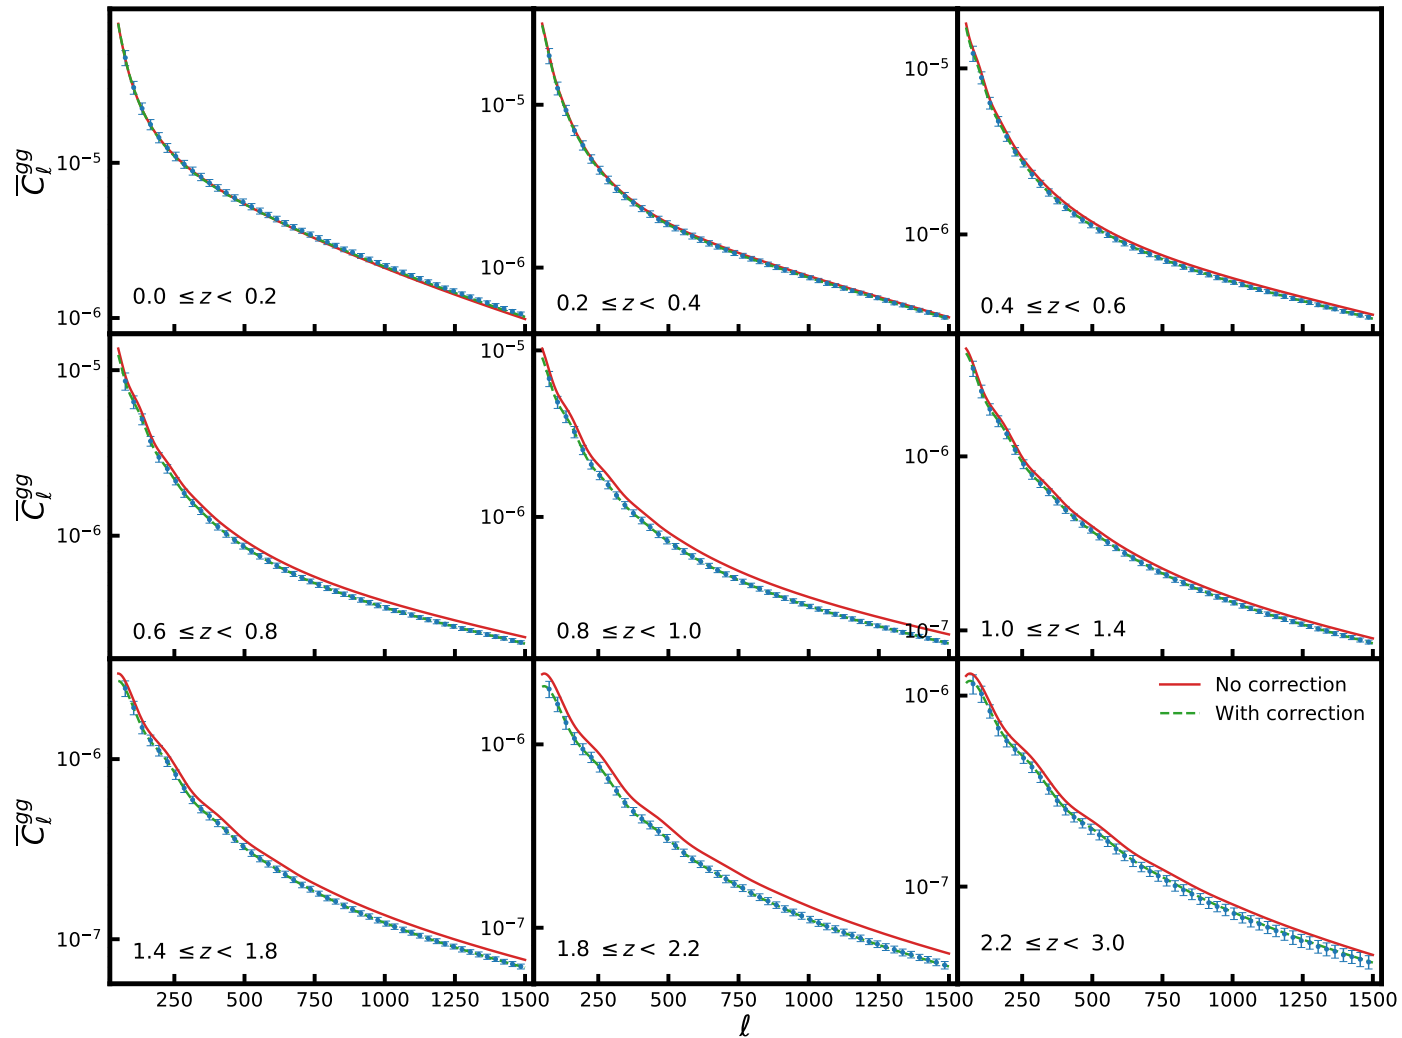

$$\hat{C}_L^{xy} = \sum_{L'} K_{LL'}^{-1} \left(\tilde{C}_{L'}^{xy} - \langle \tilde{N}_{L'}^{xy} \rangle_{MC} \right) \quad \tilde{C}_\ell^{xy} = \frac{\sum_m \tilde{a}_{\ell m}^x \tilde{a}_{\ell m}^{y*}}{2\ell + 1}$$

CosmoVerse@Lisbon, Jun 2023

Fitting parameters using the maximum likelihood method:

$$\mathcal{L}(\hat{C}_L | b, A) = \frac{1}{\sqrt{(2\pi)^{N_L} \det(\text{Cov}_{LL'})}} \times \exp\left\{-\frac{1}{2} [\hat{C}_L - C_L(b, A)] (\text{Cov}_{LL'})^{-1} [\hat{C}_L - C_L(b, A)]\right\}$$

- Linear galaxy bias: $b(z) = 1 + \frac{b_0 - 1}{D(z)}$ $C_L^{gg} \propto b(\bar{z})^2 C_L^{gg, \text{fid}}$
- Amplitude of cross-correlation A : scales the amplitude of the cross-power spectrum (equals 1 for the Λ CDM model) $C_L^{\kappa g} \propto A b(\bar{z}) C_L^{\kappa g, \text{fid}}$

Bin 5 ($0.8 \leq z < 1.0$)

Conclusions

- Tomographic cross-correlation between CMB lensing map and galaxy surveys useful for tracing time evolution of the large-scale structure
- Systematic errors caused by redshift bin mismatch of galaxies with photo-z
 - ~10-15% for galaxy auto-power spectra, ~2% for cross-power spectra ($\sigma_0 = 0.02$)
 - ~1 standard deviation for the correlation amplitude, ~10-20 standard deviations for the galaxy bias ($\sigma_0 = 0.02$)
- Needed correction for the redshift bin mismatch using scattering matrix formalism
- Possible fast computation of the scattering matrix using estimation of the true redshift distribution (needed accurate estimation of the photo-z error distribution)
